

# README

In Problem Two , we are using lex and yacc to check the strings.

Using lex, we are checking whether the string is of the form aaabbbbb which is saved as Prob2a.l in src.

Using lex and yacc we are then checking whether in the string of the form aaaabbbb i.e., a and b are equal in number.

The lex is saved as Prob2b.l and the corresponding yacc is saved as Prob2b.y

We are printing invalid string if the string does not satisfy the above condition.
